AMENDMENTS TO THE CLAIMS

Docket No.: 51407/P029US/10605267

1-25. (Canceled)

- 26. (Previously Presented) A device according to claim 29, wherein the control unit and the dressing are integrated with each other.
 - 27-28. (Canceled)
- 29. (Currently Amended) A device for treating <u>damaged</u> tissue, the device comprising:
- a dressing <u>having a treatment surface</u> for applying to a treatment area of said <u>damaged</u> tissue;
- a pair of electrodes affixed to a <u>on said</u> treatment surface of the dressing; and a control unit for passing alternating current to the treatment area via the electrodes and for constantly <u>and concurrently</u> varying the value of the amplitude of the alternating current <u>and the frequency of the alternating current</u> to electrically stimulate and repair said <u>damaged</u> tissue.
- 30. (Original) A device according to claim 29, wherein the alternating current is varied between 50 and 500 microamps.
- 31. (Previously Presented) A device according to claim 29, wherein the frequency of the alternating current is varied between 10 and 900 hertz.
- 32. (Previously Presented) A device according to claim 29, wherein the time period between each variation of amplitude is 0.1 s.
- 33. (Previously Presented) A device according to claim 29, wherein the alternating current has a ramp waveform.
- 34. (Withdrawn) A device according to claim 26, wherein the control unit is etched into a substrate.

Application No. 10/574,252 Docket No.: 51407/P029US/10605267 Amendment dated June 2, 2011

Reply to Office Action of January 7, 2011

35. (Previously Presented) A device according to claim 29, wherein the control unit comprises:

a housing; and

electronic circuitry in the housing connected to the pair of electrodes.

- 36. (Previously Presented) A device according to claim 35, wherein the electronic circuitry comprises memory storing at least one program for determining the amplitude, frequency and waveform of alternating current supplied to the electrodes.
- 37. (Previously Presented) A device according to claim 36, wherein the control unit further comprises an i/o port connected to the electronic circuitry, such that an external device can connect to the control unit via the i/o port and update the memory and control operation of the control unit.
- 38. (Previously Presented) A device according to claim 37, wherein the control unit further comprises a wireless transceiver connected to the electronic circuitry, such that an external device can wirelessly connect to the control unit via the i/o port and update the memory and control operation of the control unit.
- 39. (Previously Presented) A device according to claim 35, wherein the control unit comprises:

a pair of activation electrodes; and

a removable tab including a metallic strip connecting the activation electrodes,

wherein the electronic circuitry detects when a current can pass between the activation electrodes and only supplies current to the output electrodes when the tab is removed such that no current passes between the activation electrodes.

40-48. (Canceled)
